MA.7.NSO | Florida

Grade 7 expectations grouped under MA.7.NSO.

MA.7.NSO.1	Rewrite numbers in equivalent forms
MA.7.NSO.1.1	Know and apply the Laws of Exponents to evaluate numerical expressions and generate equivalent numerical expressions, limited to whole-number exponents and rational number bases
MA.7.NSO.1.2	Rewrite rational numbers in different but equivalent forms including fractions, mixed numbers, repeating decimals and percentages to solve mathematical and real-world problems
MA.7.NSO.2	Add, subtract, multiply and divide rational numbers
MA.7.NSO.2.1	Solve mathematical problems using multi-step order of operations with rational numbers including grouping symbols, whole-number exponents and absolute value
MA.7.NSO.2.2	Add, subtract, multiply and divide rational numbers with procedural fluency
MA.7.NSO.2.3	Solve real-world problems involving any of the four operations with rational numbers

CHAPTER

1

Integers and Absolute Value

1. Understanding Integers and the Number Line — MA.7.NSO.2
2. Absolute Value — MA.7.NSO.2
3. Comparing and Ordering Integers — MA.7.NSO.2
4. Adding Integers — MA.7.NSO.2
5. Subtracting Integers — MA.7.NSO.2
6. Multiplying Integers — MA.7.NSO.2
7. Dividing Integers — MA.7.NSO.2

1.4 Adding Integers

MA.7.NSO.2

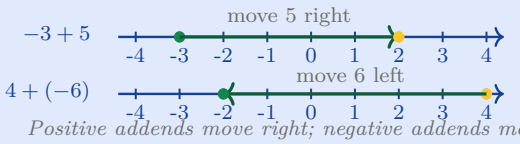

Think of adding integers as combining movements on a number line—or combining gains and losses in everyday life. Here is the key: when both numbers share the same sign, they move in the same direction, so you add the absolute values and keep that sign. When the signs are different, the numbers pull in opposite directions; you subtract the smaller absolute value from the larger one and keep the sign of whichever was stronger. You will also meet **zero pairs** (additive inverses), which show why a positive and its matching negative cancel out completely. Master these two rules and integer addition will feel natural every time.

Key Concepts & Quick Review

Same signs: Add the absolute values; keep the common sign. **Example:** $(-5)+(-8)=-(5+8)=-13$

Different signs: Subtract the smaller $|\cdot|$ from the larger; keep the sign of the larger $|\cdot|$.
Example: $(-9)+4=-(9-4)=-5$

Additive inverse: $a+(-a)=0$ **Identity:** $a+0=a$

Positive addends move right; negative addends move left.

Examples

① Evaluate $(-13)+7$.

Think It Through: The signs are different, so subtract the smaller absolute value from the larger one. That gives $13-7=6$. Now decide the sign by looking at which number has the larger absolute value. Since 13 is larger than 7, the negative number wins. So the sum is -6.

Answer: -6

② A hiker starts at 240 feet above sea level, descends 380 feet, then climbs back up 95 feet. What is the hiker's final elevation?

Think It Through: Translate the changes into integers: $240+(-380)+95$. First combine 240 and -380. Because the signs are different, subtract $380-240=140$ and keep

Scan Me

the sign of the larger absolute value, which is negative, so the result is -140. Then add 95: $-140 + 95 = -45$. The final elevation is -45 feet, which means 45 feet below sea level.

Answer: -45 *feet*

Practice Problems

Find each sum.

1. $5 + (-8) =$ _____
2. $(-6) + (-9) =$ _____
3. $(-12) + 7 =$ _____
4. $(-3) + 15 =$ _____
5. $(-14) + (-6) =$ _____
6. $8 + (-8) =$ _____
7. $(-25) + 13 =$ _____
8. $(-9) + (-11) =$ _____
9. $17 + (-24) =$ _____
10. $(-30) + 45 =$ _____
11. $(-7) + (-7) + 4 =$ _____
12. $12 + (-5) + (-9) =$ _____
13. $(-20) + (-15) + 30 =$ _____
14. $(-6) + 13 + (-4) =$ _____
15. $36 + (-49) =$ _____

Study Tips

- When adding a long list of integers, group positives together and negatives together first; then combine the two totals.
- Opposite integers cancel: $(-7) + 7 = 0$. Look for zero pairs to simplify quickly.
- The sign of the answer matches the sign of the integer with the **larger** absolute value.

Word Problems

16. During a single football drive, a team gains 14 yards on the first play, loses 19 yards on the second play, gains 8 yards on the third play, and loses 6 yards on the fourth play. Write an addition expression using integers to represent the total yardage change, and then find the result. Is the team ahead of or behind their starting position, and by how many yards?

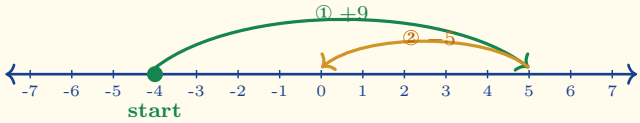

_____

17. Kenji starts the week with \$15 in his account. He deposits \$30 on Monday, withdraws \$48 on Tuesday, deposits \$12 on Wednesday, and withdraws \$22 on Thursday. Write his balance after each transaction as an addition expression, and determine whether his

account is positive or negative at the end of Thursday. If negative, how much does he owe?

_____

18. This number line shows two "jumps." The bug starts at -4, hops $+9$ along arrow ①, and then hops -5 along arrow ②. Write the addition expression for the bug's final position and find where the bug lands.

_____

1.5 Subtracting Integers

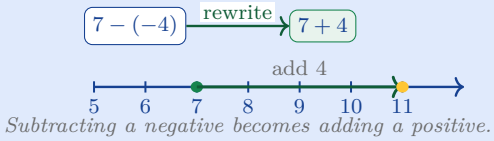

MA.7.NSO.2

Here is the secret to subtracting integers: don't treat it as something new! Every subtraction can be rewritten as **adding the opposite**: $a - b = a + (-b)$. After that one rewrite, you already know what to do—just use the integer-addition rules from the last section. Try it with $-6 - (-9)$: rewrite as $-6 + 9$, and the answer is 3. The more you practice this "add-the-opposite" move, the faster and more confident you will become with any integer subtraction problem.

Key Concepts & Quick Review

Subtraction Rule: $a - b = a + (-b)$ **Keep · Change · Change (KCC):** keep the first number, change subtraction to addition, change the sign of the second number.

Examples: $7 - (-4) = 7 + 4 = 11$ $\qquad (-5) - 9 = (-5) + (-9) = -14$
$(-3) - (-10) = (-3) + 10 = 7$

Subtracting a negative becomes adding a positive.
